STUDENT RESEARCHER: Dawn Kowalczyk (48786016)

[DECO3500] Social and Mobile Computing, Semester 2, 2026.

We are interested in improving concert audiences' experience in the time before a live performance in music venues through wearable devices to encourage social interaction. This interview aims to better understand the concert experience, especially social interaction.

Your participation is an interview session (Duration: ~20 minutes). The tester facilitates the interview to understand the users values and listen to the concert experience. I will take notes and record the session to use for research purposes, as explained separately. Personal information will be de-identified. Participation is voluntary; you are free to withdraw from the study at any time, without penalty. The collected data will be shared after the session, ensuring co-ownership. Do you agree to proceed?

Questions

1. When you go to a concert alone, what do you usually do before the show starts?
2. How do you feel about talking to or meeting new people when you are there alone?
3. Can you tell me about a time when you wanted to talk to someone at a concert but didn't? What stopped you?
4. How do you usually tell whether someone at a concert is open to talking or prefers to be left alone?
5. What would make interacting with other people at a concert feel more natural and comfortable for you?
6. Imagine there was a way to show other solo concert-goers whether you're open to interacting, without having to approach them first. How would you feel about that?
7. If this was communicated through a wearable device rather than your phone, what would make you feel comfortable or uncomfortable using it?
8. What are your general socialising tips?
9. What memorable activities did you do at the concert?
10. What do you think about a customised social game function?
11. How about privacy? What do you think about selective access to information?

Concert social interaction Interview

September 03, 2026

Summary by Otter.ai

A researcher, interviews a concert-goer about social interaction at concerts. The interviewee enjoys meeting new people and values small talk to break the ice. They feel anxious about approaching others due to uncertainty. Eye contact and positive expressions indicate openness to conversation. The interviewee supports the idea of a wearable device that signals openness to interaction, which would reduce anxiety. They emphasize the importance of natural interactions, avoiding excessive mobile use, and being comfortable with oneself. They also suggest that a customizable social game on a wearable device could increase engagement and privacy features are crucial for digital identity management.

Transcripts

Speaker 1 00:05

Thank you. So I'm Dawn, and we are interested in improving concert audiences' experience in the time before a live performance in music venues through wearable devices to encourage social interaction. This interview aims to better understand the concert experience, especially social interaction. Your participation is an interview session, 20-minute durations, up to 20 minutes. The tester facilitates the interview to understand the values of participants and listen to your concert experience. I will take notes and record this session to use for research purposes. And as explained separately, personal information will be de-identified. Participation is voluntary. You are free to withdraw from the study at any time without penalty. The collected data will be shared after the session, ensuring co-ownership. Do you agree to proceed?

Speaker 2 01:05

Yes.

Speaker 1 01:16

So, first question is, when you go to a concert alone. What do you usually do before the show starts?

Speaker 2 01:32

Get a drink and enjoy a beverage. Talk to people, meet somebody I haven't met before, and enjoy the ambiance.

Speaker 1 01:57

Okay. So, how do you feel about? So you already mentioned that you talk to other people. So how do you feel about talking to or meeting new people when you are there or you want?

Speaker 2 02:12

I feel excited at the prospect of being able to meet somebody new. It's interesting to meet somebody. You never know how long someone will be in your life for. So it's interesting. You can learn something new from somebody, even if you only meet them for a short time. But I believe enjoying something with another person makes the whole experience more enjoyable.

Speaker 1 02:52

Okay, that's great. So, can you tell me about a time? Can you tell me about the time when you wanted to talk to someone at a concert? So I'll repeat. Can you tell me about a time when you wanted to talk to someone at a concert but didn't? What stopped you?

Speaker 2 03:37

Oh, probably not knowing if I was being impolite or rude or interrupting them or something like that.

Speaker 1 03:58

So the possibility you didn't know that they want.

Speaker 2 04:03

Yes, uncertainty.

Speaker 1 04:04

Uncertainty. I agree. So, how do you usually tell whether someone at a concert is open to talking or prefer to be left alone?

Speaker 2 04:17

Eye contact and positive expression, like a smile.

Speaker 1 04:26

I see. And what would you make interacting with other people at a concert feel more? You already mentioned, like, yeah. Is there anything else to make you feel more natural or comfortable for you. What would make interacting with other people at a concert

feel more natural and comfortable for you?

Speaker 2 04:53

Dancing. Talking about something. Usually, when you start to talk to somebody you haven't met, there's some **small talk, which breaks the ice**, and so I believe that certainly makes it more easier, more comfortable talking to somebody. If you do that small talk and it doesn't go well, for example, you pick up some kind of a negative vibe, then it's likely that you will stop talking to them and do something else.

Speaker 1 05:57

I see. Thank you. And imagine there was a way to show other solo concert goers whether you are open to interacting without having to approach them first. How do you feel about that? Sorry,

Speaker 2 06:37

I would feel much more **At ease** and **less anxious**. Well, you have an **indication that they are open to conversation**. You **don't have to do any kind of guesswork**. You **don't have to take any risk**, so it makes the **decision easier**.

Speaker 1 07:08

Okay, that's good. If this was communicated through a wearable device rather than your phone, what would you make you feel comfortable or uncomfortable using it, so somewhere every device shows into possible open to interact, open to talk.

Speaker 2 07:33

Yeah, if I had that kind of a device, I would **feel more comfortable**.

Speaker 1 07:59

But how about like privacy? So anything make you uncomfortable

Speaker 2 08:08

no? Because it's a public space, and the concept of using a device like that is kind of like an **aid or a tool**, so it's **not really a concern about privacy** because it's **performing a function**.

Speaker 1 08:33

Okay. So, So let's do more general one. What are your general socializing tips? It can be closer to, but also just general socializing tips.

Speaker 2 08:57

When when you are alone. You need to be comfortable being alone, and it's good to have something to preoccupy you. But I would warn **against using a mobile too much**, because I think these days in society there's a propensity to have the face in the mobile, which **limits the eye contact and the chance for organic, natural, spontaneous chances to to meet and talk to people**. I generally find that most of the time people will be open to socializing because most people are there for that reason, so it doesn't really matter if you have any preconceptions, because people are there to enjoy your time together, and if for any reason you feel like you're not enjoying your time, you just leave, and you have to be **comfortable with making that decision**.

Speaker 1 10:28

To ensure your social adjectives as a keyword is

Speaker 2 10:33

know thyself.

Speaker 1 10:35

Like natural.

Speaker 2 10:37

Yeah, yeah. Don't don't be **don't be too focused on an outcome**. **Go with the flow**. Yes, yes.

Speaker 1 10:51

Natural, more natural interactions.

Speaker 2 10:54

Yes, and enjoy **enjoy the experience**. **Have fun**. Some people have fun in different ways. Some people have fun at the expense of others. So just enjoy yourself reasonably, so that you don't impede on the fun of other people, enjoyment of other people.

Speaker 1 11:20

That's good. How about what what memorable activities did you do at the concert?

Speaker 2 11:32

So memorable activities would include dancing, Listening to the music and talking to people about various interesting topics.

Speaker 1 11:55

So, what if that device, the wearable device. Probably we are we are considering connecting with the app and wearable device. What if you can customize the game like like social game? We're thinking we are thinking about open for the social activity, but also like social games as well. We are we are doing we are initially making lots of ideas, and if you, what if that has that customizable game? What do you think?

Speaker 2 12:38

I think that would make it more interesting and more engaging. It may encourage people to use the device more and make it more successful. Because if not enough people use the device, it probably won't work as well. So to provide some incentive for people to use it might be good, provided it's not a paid incentive. It needs to be fun in and of itself.

Speaker 1 13:18

Oh, good, thank you. We are also thinking about the interaction is not overwhelming because we want to give yeah like you mentioned more natural interaction.

Speaker 2 13:31

yeah don't distract

Speaker 1

So so we thinking about peripara interactions. In the case like we want to use like synthesized or vibration or haptic features. What do you think about it? Can do not yes as a signal.

Speaker 2 13:53

Yeah, those kinds of things sound sound good and non-intrusive.

Speaker 1 14:04

Yeah. Okay. So this is might be a last question. So, like about the privacy issues. So we we open we we share this device share the social openness, but also we thinking about keeping some like privacy factors or autonomy, so the person Can choose the information they want to share. For example, selective access to information. That's the access. what do you think about it?

Speaker 2 14:58

I think from what I understand, the **privacy first approach** is the best. You should work with a minimum viable product. You know, think about **all the privacy features** that you may need or want, and design the product in a way that would work if you have all of the privacy available to you. The **most minimum approach does that work as a product**? What's the what do you need to expose to make the product work. It sounds to me. Did that answer the question? What was the question again?

Speaker 1 15:50

You have to think about the selective information function.

Speaker 2 15:56

I think it's **really important**, and it's become more important these days. Now that we are becoming more digitally literate and understand our digital identity more and more these days, yes, this kind of a concept and awareness and understanding is not only important but **imperative**.

Speaker 1 16:24

That's great. Thank you for your participation, and if you want to get this data, I can share with you. Okay. Thank you

Speaker 2 16:33

Thank you.
